

How to Add a Letter

Letters, From Me — love-letter-henna.vercel.app

Every letter lives in one file — `letters.jsx` — and everything else (the fanned spread, the click handling, the unfolding animation) automatically adjusts to however many letters are in that list.

Adding a letter

Open `letters.jsx` and find the last letter (the one titled “An open one”, ending with `}`). Add a comma after its closing `}`, then paste a new block like this before the `]`:

```
{
  "id": 6,
  "date": "Jul 12, 2026",
  "title": "The one about summer",
  "envelopeColor": "#e9d8c4",
  "wax": "#8a4a3a",
  "body": "My love,\n\nWrite your letter here.\n\nYours,\nMe"
}
```

What each field does:

- **id** — just a unique number. Use the next one up (6, then 7, ...).
- **date** — any text you like. It shows on the envelope and at the top of the paper. “Whenever” is a valid date, as letter 5 proves.
- **title** — the little handwritten label on the envelope (“— The one about summer”).
- **envelopeColor** — the paper color of the envelope, as a hex color. The existing five are all warm cream/peach tones (`#f4d6c0` , `#e8d4b8` , ...), so picking something in that family keeps the spread looking harmonious.
- **wax** — the color of the wax seal and stamp.
- **body** — the letter itself. This is the one thing with a quirk: **the whole letter is written on a single line**, and line breaks are typed as `\n`. So `\n\n` means “blank line between paragraphs” and a single `\n` is just a new line. Apostrophes (don’t, you’re) are fine as-is; only actual double-quote marks would need a backslash before them (`\"`).

Two things worth knowing

1. **The envelope spread scales itself.** With 6 letters the fan just gets slightly wider — each envelope’s angle is calculated from how many there are, so nothing else needs editing.
2. **The 3D pile inside the mailbox stays at five envelopes.** Those little envelopes in the 3D box are decoration — they aren’t the clickable letters (the clickable ones are the flat spread that appears after the

camera arrives). So adding a 10th letter won't overstuff the 3D mailbox; it'll always look like a cozy handful.

Making it live

A new letter goes live the same way any change does: commit it, and merge/push to `main` — Vercel redeploys automatically in about a minute. On any other branch nothing goes live, so you can draft letters there safely.
